SUMMER CULTURE IN SOUTH FLORIDA

– Anton Kuhn (Floton's)

If you cut your Hibiscus back in March and fertilized them, they should be fertilized in June with 4-8-8. Use the same spray as recommended for March. Do little trimming, just pinch out the straggling bits of branches. Watering must be watched during the long, dry spells. Be sure to water your Hibiscus well, once a week and be careful to have them placed for good drainage in the rainy season. A too dry or too wet condition encourages Blackspot and poor root syatems.
